The kitchen door and the kitchen windows can be positioned freely. One of the most important steps in remodeling a kitchen is taking measures. The correct measures ensure that the kitchen cabinets are the right size. Since the cabinets are a central feature of the kitchen, it is important to get comprehensive and accurate measurements. The appropriate measures will make the order and installation of ready-to-assemble (RTA) cabinets easy. When buying kitchen cabinets RTA, a homeowner can view online images and order samples for assistance in choice. However, taking appropriate measures is the only way to make sure that the cabinets fit into the kitchen space. Knowing the exact measures of the kitchen makes it even easier to understand a budget for renovation. Prepare to measure your kitchen cabinets Measuring kitchen furniture can be done without having to remove the cabinets immediately. Measuring the size of the wall can be done easily in a few minutes. Taking the measures of a kitchen is not difficult, but it must be done carefully. In order to take measures for the new kitchen cabinets, the following elements are necessary: size strip grid/carceculatorstep stool or scale level ruler (indicates the additional work that may be necessary) laser measuring instrument (not necessary, but can be used to double osotsoc osotsoc nu eresse ²Âup enoizarf amissorp alla opport eradnotorra ehcnA .azzetarucca'l eritnarag rep etlov eud erusim el erednerp e elibissop osicerp ¹Âip li eresse ebbervod asac id oirateirporp li ,arusim is odnauQ)ollortnoc id erusim All measurements should be written in inches.Ã Â How to Measure Step-by-Step This step-by-step guide will ensure that homeowners will have the correct measurements for their new kitchen cabinets, even if they have never measured for them before. Make a Rough Sketch.Ã Â The first step is to draw a rough plan of the existing kitchen, or the new blueprint if anything in the kitchen will be changed.Ã Â The use of grid paper can make drawing the layout easier.Ã Â All appliances, windows, and doors should be labeled. Electrical, plumbing, and vents should also be marked.Ã Â A key like the one below can be used to mark all of the items in the kitchen.The layout drawing does not need to be perfect, but it should be clear and easy to understand.Take Horizontal Measurements.Ã Â The customer needs to measure the entire wall space if a kitchen overhaul is being done so they know how they can reconfigure the cabinets.Ã Â If the homeowner is only replacing cabinets within the current layout, the measurements of the current cabinets should be measured as well. Measurements should be taken from wall edge to wall edge in order to get the total space. The measurements for openings like doors or windows are taken from one underside of trim to the other underside of trim. The trim or molding around it are not included in the measurement. Ã ÂTip:Ã Â All of the numbers should be written clearly so they are legible later and rounded to the nearest one-sixteenth of an inch.Take Vertical Measurements.Ã Â The distance from floor to ceiling at each corner and the middle of each wall should be noted on the rough sketch. The house might have settled so it is important to measure several parts of the wall. The ceiling height indicated the ideal height of the upper cabinets. Measurements should take soffits into consideration.Ã Â The soffit is the little wall that hangs down from the ceiling in front of certain areas like doors. If the kitchen has soffits, from the floor to the bottom of the soffit.Ã Â Ceiling heights are normally 8 feet in older homes, and 9 feet in newer homes.Ã Â Some homes might have even higher ceilings of 10 to 12 feet.Find the Center Point of Existing Fixtures.Ã Â Unless the kitchen layout is completely changing, existing features of the kitchen such as appliances, sink, and windows must be considered.Ã Â The homeowner should measure the center point of all features. To find the center point of the sink or stove, start at the end closest to the wall and measure toward the sink or stove. The measurements stops at the middle part of the sink or center of the stove.Ã Â If the sink or stove is located in an island, measure at the end of the island. For water and gas lines, measure form the wall to the center of the pipe or center of the appliance if it is still there. Measure Doors and Windows. The same process should be completed for the windows and doors, the height and width should be recorded as well. Ã ÂIf the sink is centered on a window, this ensures the correct placement of the cabinets that are closest to the window.Ã Â The standard size for doors is 80¢ÂÂÂx30¢ÂÂÂ, but the width can be as wide as 36 inches or as narrow as 28 inches. Ã ÂWindows come in a variety of sizes, especially depending on the age of the home, so it is best to take kitchen window measurements twice.Ã Â Door and window frames and trim should be excluded from measurements.Measure the Distance Between Objects to the Floor and Ceiling. The customer should next find the distance between objects on the wall and the floor and ceiling.Ã Â This ensures that there are no obstacles in the way of the cabinets.Ã Â If an object is located over an installation spot, such as a window, the cabinets might need to be moved in order to accommodate it.Ã Â If the flooring has been removed, then it will change the vertical measurement, but will not change the ceiling height.Ã Â Items such as ventilation, outlets, protruding walls, walkway dimensions for island installations should all be included in the floor plan.Measure Existing Cabinets. The existing cabinets should also be measured to see what will fit.Ã Â The homeowner should measure the height, width, and depth to get an idea of what the current cabinets are and if that size will work for the kitchen renovation.Ã Â Depending on the cabinet¢ÃÂÂs design, it might have additional features such as a toe kick, oversized countertop, or frameless door. Ã ÂFor situations where only the cabinets are being replaced, this will give an idea of the measurements needed for the new cabinets. What Happens When the Measurements are Incorrect Measuring for kitchen cabinets accurately is vital because if they are measured incorrectly, there can be a few mishaps in the kitchen renovation. An incorrect measurement can be costly, throwing off the entire design.Ã Â When an error is made during the measuring process, it is possible that the cabinets will need to be returned.Ã Â This is not an easy process due to the size of cabinets. There are shipping and restocking fees that the homeowner will need to pay, making this an expensive mistake. If the old cabinets have already been removed, the homeowner might be without a functioning kitchen for awhile. In addition, the homeowner will not know that an error has occurred until the cabinets are installed.Ã Â Ã ÂDepending on how the dimensions were measured, there can be a host of issues with installation.Ã Â For example, the cabinets might not reach all the way to the wall, or a drawer might not be able to fully open. The cabinets might not be level and the entire process will need to be repeated.Ã Â Double-checking measurements will help make sure this does not occur.
